

# FX803 Audio Signalling Processor

Fig.1 FX803 Audio Signalling Processor

## FX803 Audio Signalling Processor

As part of the DBS 800 System, this audio signalling processor will provide an inband tone signalling facility for PMR radio systems. Signalling systems supported include Selcall (CCIR, ZVEI I, II and III, EEA), 2-Tone Selcall and Dual Tone Multi-Frequency (DTMF) encode.

Using a non-predictive tone decoder and versatile encoders gives the FX803 the capability to work in any standard or non-standard tone system.

This is a full-duplex device consisting of:

- Two individual tone generators and a programmable (Tx) period timer.
- A tone decoder with programmable NOTONE Timer.
- An on-chip summing amplifier.

For use with Single Tone or Selective Call systems.

Under the control of the  $\mu$ Controller, via "C-BUS," the FX803 will encode and transmit a single or pair of audio tones, in the frequency range 208Hz to 3kHz, simultaneously, and detect, decode and indicate the frequency of non-predicted input tones in the frequency range 313Hz to 6kHz.

Both tone generators can be individually placed into a power economical "Powersave" mode.

A general purpose logic input, interfacing directly with the Status Register, is provided. This could be used as an auxiliary method of routing digital information to the  $\mu$ Controller via the "C-BUS."

The output frequencies are produced from data loaded to the device, with a programmable, general purpose, on-chip timer available to indicate the tone transmit periods.

A Dual Tone Multi-Frequency (DTMF) output is obtained by combining the 2 independent output frequencies in the integral summing amplifier. This Summing Amplifier output is also available for level adjustment.

Tones produced by the FX803 can also be used in the DBS 800 system as modulation calibration inputs and for "CUE" audio indications for the operator.

Received tones are measured and their frequency indicated to the  $\mu$ Controller in the form of a received data word. A poor-quality or incoherent tone will, after a programmed period, indicate NOTONE.

The FX803 is a low-power, 5-volt CMOS integrated circuit and is available in 24-pin DIL cerdip and 24-pin/lead plastic SMD packages.

## Pin Number Function

J/LG/LS	DW					
1	1	<b>Xtal:</b> The output of the on-chip clock oscillator. External components are required at this input when a Xtal input is used. See Figure 2.				
2	2	<b>Xtal/Clock:</b> The input to the on-chip clock oscillator inverter. A Xtal or externally derived clock ( $f_{XTAL}$ ) should be connected here. See Figure 2.				
3	3	<b>Reply Data:</b> The “C-BUS” serial data output to the $\mu$ Controller. The transmission of Reply Data bytes is synchronized to the Serial Clock under the control of the Chip Select input. This 3-state output is held at high-impedance when not sending data to the $\mu$ Controller. See Timing Diagrams.				
4	5	<b>Chip Select (<math>\overline{CS}</math>):</b> The “C-BUS” data loading control function. This input is provided by the $\mu$ Controller. Data transfer sequences are initiated, completed or aborted by the $\overline{CS}$ signal. See Timing Diagram.				
5	6	<b>Command Data:</b> The “C-BUS” serial data input from the $\mu$ Controller. Data is loaded to this device in 8-bit bytes, MSB (B7) first, and LSB (B0) last, synchronized to the Serial Clock. See Timing Diagrams.				
6	7	<b>Logic Input:</b> This ‘real-time’ input is available as a general purpose logic input port which can be read from the Status Register. See Table 3.				
7	8	<p><b>Interrupt Request (<math>\overline{IRQ}</math>):</b> The output of this pin indicates an interrupt condition to the <math>\mu</math>Controller, by going to a logic “0.” This is a “wire-or able” output, allowing the connection of up to 8 peripherals to 1 interrupt port on the <math>\mu</math>Controller. This pin has a low-impedance pulldown to logic “0” when active and a high-impedance when inactive. The System <math>\overline{IRQ}</math> line requires one pullup resistor to <math>V_{DD}</math>. The conditions that cause interrupts are indicated in the Status Register and are shown below:</p> <table style="margin-left: auto; margin-right: auto;"> <tr> <td style="text-align: center;">G/Purpose Timer Period Expired</td> <td style="text-align: center;">NOTONE Timer Period Expired</td> </tr> <tr> <td style="text-align: center;">Rx Tone Measurement Complete</td> <td></td> </tr> </table> <p>These interrupts are inactive during relevant Powersave conditions and can be disabled by Bits 5 and 6 in the Control Register.</p>	G/Purpose Timer Period Expired	NOTONE Timer Period Expired	Rx Tone Measurement Complete	
G/Purpose Timer Period Expired	NOTONE Timer Period Expired					
Rx Tone Measurement Complete						
8	4	No internal connection, connect to $V_{SS}$ .				
9	9	No internal connection, connect to $V_{SS}$ .				
10	10	<b>Audio Switch In:</b> The input to the stand-alone, on-chip Audio Switch. This switching function (Control Register Bit 7) may be used to break the system transmitter modulation path when it is required to provide a CUE (beep) from Tone Generator 2 to the loudspeaker via the FX806 PLMR Audio Processor.				
11	11	<b>Audio Switch Out:</b> The output of the stand-alone, on-chip Audio Switch.				
12	12	<b><math>V_{SS}</math>:</b> Negative Supply (Signal Ground).				

## Pin Number Function

J/LG/LS	DW	
13	13	<b>(Rx) Audio In:</b> The received audio tone signalling input to the Input Amplifier. This input requires to be a.c. coupled and connected, using external components, to the Signal Input Bias pin. See Figure 2.
14	14	<b>Signal Input Bias:</b> External components are required between this input and the (Rx) Audio In pin. See Figure 2.
15	15	<b>V<sub>BIAS</sub>:</b> The internal circuitry bias line, held at V <sub>DD</sub> /2 this pin must be decoupled to V <sub>SS</sub> by capacitor C <sub>2</sub> . See Figure 2.
16	16	<b>Tone 1 Out:</b> Tone 1 Generator (2-/5- tone Selcall or DTMF 1) output. External gain and coupling components will be required at this output when operating in a complete DBS 800 audio installation. The frequency of this output is determined by writing to Tx Tone Generator 1 Register (Table 4). See Figure 2.
17	17	<b>Tone 2 Out:</b> Tone 2 Generator (2-/5- tone Selcall, CUES or DTMF 2) output. External gain and coupling components will be required at this output when operating in a complete DBS 800 audio installation. The frequency of this output is determined by writing to Tx Tone Generator 2 Register (Table 5). See Figure 2.
18	18	<b>CAL/CUES Out:</b> An auxiliary, selectable tone frequency output, providing a square wave CALibration signal from Tone 2 Generator or a sine wave CUES (beep) signal from the Summing Amplifier. The output mode (CAL or CUES) is selected by Bit 14 in the Tx Tone Generator 2 Register (Table 5). In a DBS 800 audio installation, this output should be connected to the Calibration Input of the FX806 PLMR Audio Processor. When Tone Generator 2 is set to V <sub>BIAS</sub> (NOTONE), the CAL output is pulled to V <sub>BIAS</sub> and during a powersave of Tone Generator 2 it is held at V <sub>SS</sub> .
19	19	<b>Sum In:</b> The input to the on-chip Summing Amplifier. This amplifier is available for combining Tone 1 and Tone 2 outputs (DTMF). Gain and coupling components should be used at this input to provide the required system gains. See Figures 2 and 3.
20	20	<b>Sum Out:</b> The output of the on-chip Summing Amplifier. Combined tones (1 and 2) are available at this output. See Figures 2 and 3.
21	21	<b>Switched Sum Out:</b> The combined tone output available for transmitter modulation. The switch allows control of the FX803 final output to the FX806. Control of this switch is by Bit 4 of the Control Register. See Figures 2 and 3.
22	22	No internal connection, connect to V <sub>SS</sub> .
23	23	<b>Serial Clock:</b> The "C-BUS" serial clock input. This clock, produced by the $\mu$ Controller, is used for transfer timing of commands and data to and from the Audio Signalling Processor. See Timing Diagrams.
24	24	<b>V<sub>DD</sub>:</b> Positive supply rail. A single +5-volt power supply is required. Levels and voltages within the Audio Signalling Processor are dependent upon this supply.
<p><b>NOTE:</b> (i) Further information on external components and DBS 800 system integration of this microcircuit are contained in the System Support Document.</p> <p><i>"C-BUS" is CML's proprietary standard for the transmission of commands and data between a <math>\mu</math>Controller and DBS 800 microcircuits. It may be used with any <math>\mu</math>Controller, and can, if desired, take advantage of the hardware serial I/O functions embodied into many types of <math>\mu</math>Controller. The "C-BUS" data rate is determined solely by the <math>\mu</math>Controller.</i></p>		

# External Components

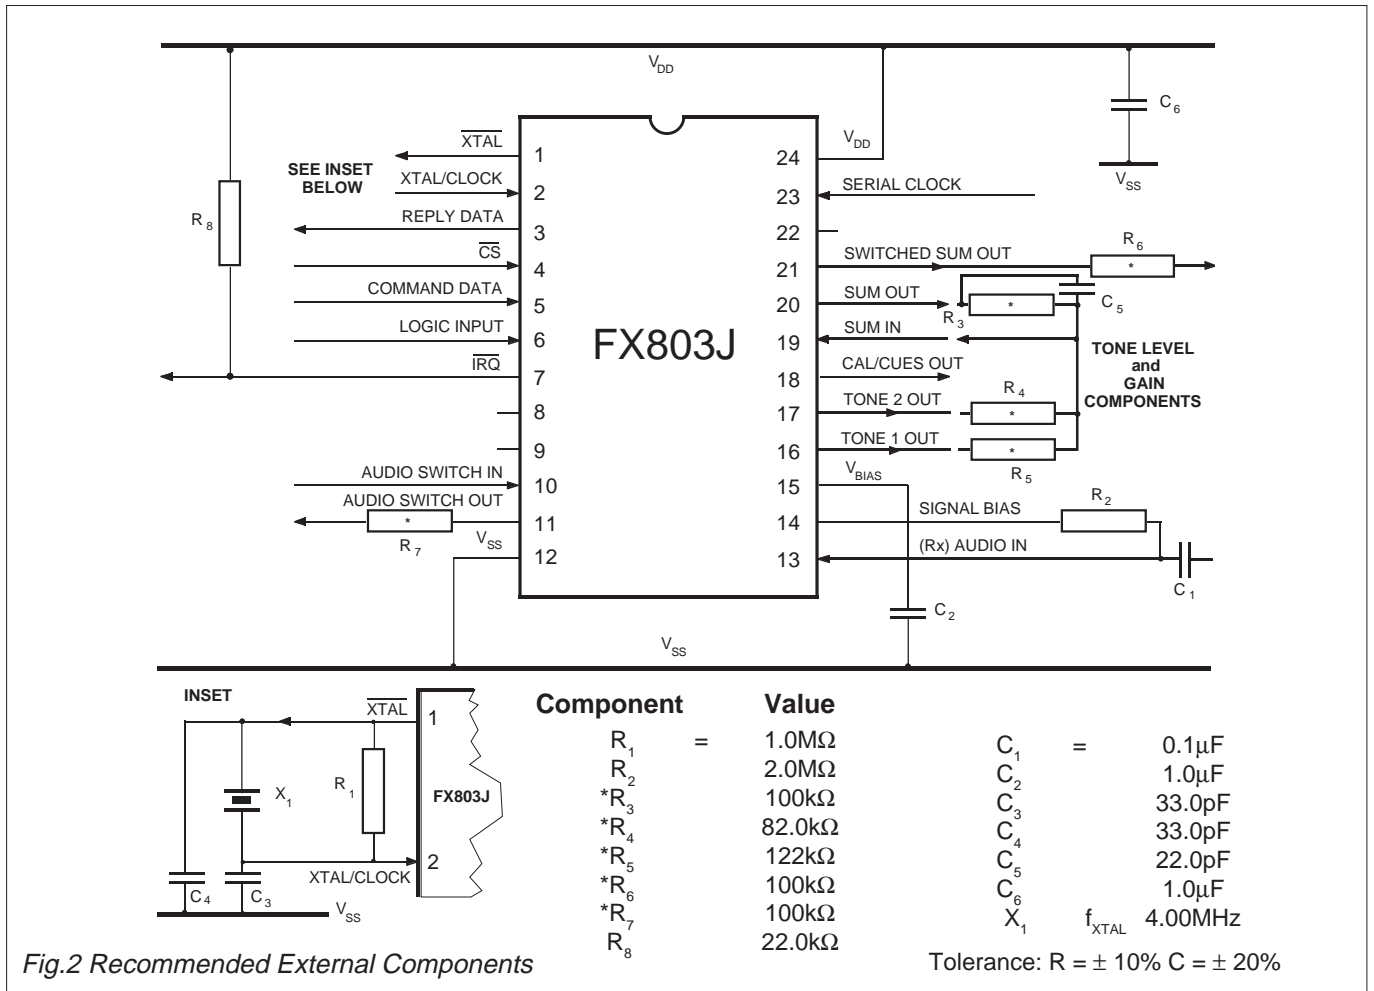

Fig.2 Recommended External Components

## Notes

1. Xtal/clock circuitry components shown INSET are recommended in accordance with CML Application Note D/XT/1 April 1986. The DBS 800 System Support Document contains additional notes on the use of Xtal/clock frequencies (f<sub>XTAL</sub>).
2. It is recommended that, to improve screening and reduce noise levels around the FX803, Pins 8, 9 and 22 are connected to V<sub>SS</sub>.
3. Resistors marked with an asterisk (\*) are System Components, calculated to operate in a system with other DBS 800 microcircuits. Figure 3 shows in detail, these components used in the System signal paths. R<sub>3</sub>, R<sub>4</sub>, R<sub>5</sub>, C<sub>5</sub> – Tone mixing components to provide a 3dB tone-differential (twist) when used in a DTMF configuration. Single tone output levels are set independently or by the FX806 Modulator Drivers. R<sub>7</sub> – Modulation level and matching for inputs to the FX806.

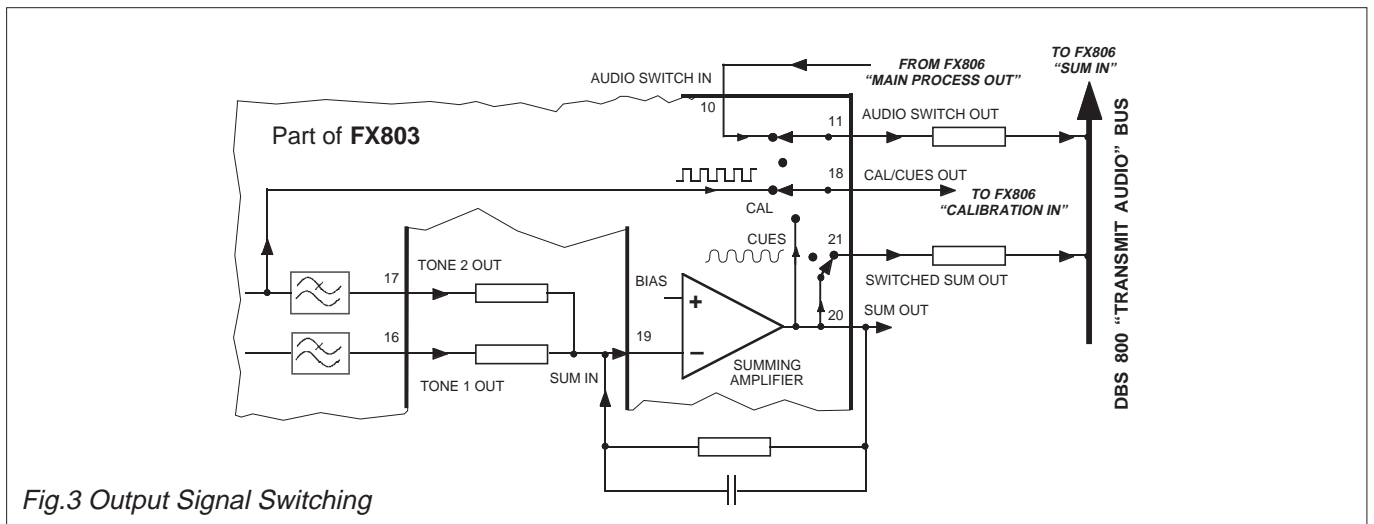

Fig.3 Output Signal Switching

# Controlling Protocol

Control of the FX803 Audio Signalling Processor's operation is by communication between the  $\mu$ Controller and the FX803 internal registers on the "C-BUS," using Address/Commands (A/Cs) and appended instructions or data (see Figure 7). The use and content of these instructions is detailed in the following paragraphs and tables.

## FX803 Internal Registers

FX803 internal registers are detailed below:

**Control Register (30<sub>H</sub>)** – Write Only, control and configuration of the FX803.

**Status Register (31<sub>H</sub>)** – Read Only, reporting of device functions.

**Rx Tone Frequency Register (32<sub>H</sub>)** – Read Only, indicates frequency of the last received input.

**Rx NOTONE Timer Register (33<sub>H</sub>)** – Write Only, setting of the Rx NOTONE period.

**Tx Tone Generator 1 Register (34<sub>H</sub>)** – Write Only, setting the required output frequency from Tx Tone Generator 1.

**Tx Tone Generator 2 Register (35<sub>H</sub>)** – Write Only, setting required output frequency from Tx Tone Generator 2.

**General Purpose Timer Register (36<sub>H</sub>)** – Write Only, setting of a general purpose, sequential time period.

## Address/Commands

The first byte of a loaded data sequence is always recognized by the "C-BUS" as an Address/Command (A/C) byte. Instruction and data transactions to and from this device consist of an Address/Command byte followed by either:

- (i) further instructions or data or,
- (ii) a Status or data Reply.

Instructions and data are loaded and transferred, via "C-BUS," in accordance with the timing information given in Figures 7 and 8.

Table 1 shows the list of A/C bytes relevant to the FX803. A complete list of DBS 800 "C-BUS" Address allocations is published in the System Support Document.

Command Assignment	Address/Command (A/C) Byte			+ Data Byte/s
	Hex.	MSB	LSB	
General Reset	01	0 0 0 0	0 0 0 1	
Write to Control Register	30	0 0 1 1	0 0 0 0	+ 1 byte Instruction to Control Register
Read Status Register	31	0 0 1 1	0 0 0 1	+ 1 byte Reply from Status Register
Read Rx Tone Frequency	32	0 0 1 1	0 0 1 0	+ 2 byte Reply from Rx Tone Register
Write to NOTONE Timer	33	0 0 1 1	0 0 1 1	+ 1 byte Instruction to NOTONE Register
Write to Tx Tone Gen. 1	34	0 0 1 1	0 1 0 0	+ 2 byte Instruction to Tx Tone Gen. 1
Write to Tx Tone Gen. 2	35	0 0 1 1	0 1 0 1	+ 2 byte Instruction to Tx Tone Gen. 2
Write to G/Purpose Timer	36	0 0 1 1	0 1 1 0	+ 1 byte Instruction to G/Purpose Timer

Fig.4 FX803 Frequencies

# Controlling Protocol .....

“Write to Control Register” – A/C 30<sub>H</sub>, followed by 1 byte of Command Data.

### Audio Switch

See the Signal Switching diagram (Figure 3) and DBS 800 Document for application examples.

### General Purpose Timer

Should be set up before interrupts are enabled, as a General Reset command will set the timer period to 00<sub>H</sub> – 0ms (permanent interrupt).

### Interrupt Enable Instructions

Status Bits 0, 1 and 2 are produced regardless of the state of these settings.

### Band Selection

Bits 2 and 3 set the required frequency range (see Figure 4, FX803 Frequencies).

### Summing Switch

To break the FX803 drive to the FX806 PLMR Audio Processor (see Figure 3, Signal Switching).

### Interrupt Designation

Decoder Interrupts:  
No Tone Timer and Rx Tone Measurement.  
Transmitter Interrupt:  
G/Purpose Timer Interrupt.

Setting		Control Bits
<b>MSB Bit 7</b>	1	<b>Transmitted First Audio Switch</b> Enable Disable
	0	
<b>6</b>	1	<b>G/Purpose Timer Interrupt</b> Enable Disable
	0	
<b>5</b>	1	<b>Decoder Interrupts</b> Enable Disable
	0	
<b>4</b>	1	<b>Summing Switch</b> Enable Disable
	0	
<b>3 2</b>	0 0	<b>Band Selection</b> High Band  Mid Band  Extended Band  Do Not use this setting
	0 1	
1 0		
<b>1</b>	1 1	Set to “0”
	0 0	
<b>0</b>	0 0	Set to “0”
	0 0	

Table 2 Control Register

“Read Status Register” – A/C 31<sub>H</sub>, followed by 1 byte of Reply Data.

Reading	Status Bits
<b>MSB Bit 7</b>	<b>Received First</b> Set to “0”
<b>6</b>	Set to “0”
<b>5</b>	Set to “0”
<b>4</b>	Set to “0”
<b>3</b>	<b>Logic Input Status</b> “1” “0”
<b>2</b>	<b>G/Purpose Timer Period</b> Expired (IRQ generated if enabled) (Table 2)
<b>1</b>	<b>NOTONE Timer Period</b> Expired (IRQ generated if enabled) (Table 2)
<b>0</b>	<b>Rx Tone Measurement</b> Complete (Interrupt Generated)

Table 3 Status Register

### Interrupt Requests (IRQ)

Interrupts on this device are available to draw the attention of the  $\mu$ Controller to a change in the condition of the bit in the Status Register. However Bits are set in the Status Register irrespective of the setting of interrupt enable bits (Table 2) and these changes may be recognized by ‘polling’ the register.

### General Purpose Timer Period

**Set** to a logic “1” when the timer period has expired.  
**Cleared** to a logic “0,”

- i By a read of the Status Register or,
- ii New G/Purpose Timer information or,
- iii General Reset Command

### NOTONE Timer Period

**Set** to a logic “1” when the timer period has expired.  
**Cleared** to a logic “0,”

- i By a read of the Status Register or,
- ii New NOTONE Timer information or,
- iii General Reset Command

### Rx Tone Measurement

**Set** to a logic “1” when the Rx Tone measurement is complete.

**Cleared** to a logic “0,”

- i By a read of the Status Register or,
- ii General Reset Command

# Controlling Protocol .....

## Tx Tone Generator Registers 1 and 2

Each Tx Tone Generator is controlled individually by writing a two-byte command to the relevant Tx Tone Generator Register. The format of this command word, which is different for each tone generator, is shown below with the calculations required for tone frequency ( $f_{TONE}$ ) generation described in the following text.

**“Write to Tx Tone Generator 1 Register”** – A/C 34<sub>H</sub> followed by 2 bytes of Command Data.

MSB (loaded first)		Bit Numbers												LSB (loaded last)	
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
“0”	“0”	$V_{BIAS}/$ Enable	These 13 bits (0 to 12) are used to produce a binary number, designated “A.” “A” is used in the formulas below to set the Tx Tone 1 frequency ( $f_{TONE 1}$ ).												
The binary number produced by bits 0 to 12 (MSB) is designated “A.” If “A” = all logic “0” then Tx Tone Generator 1 is Powersaved.						Bit 13 at logic “1” = Tone 1 Output at $V_{BIAS}$ (NOTONE). “0” = Tone 1 Output Enabled. Bits 14 and 15 (MSB) must be logic “0.”									
<i>Table 4 Setting Tx Tone Generator 1</i>															

**“Write to Tx Tone Generator 2 Register”** – A/C 35<sub>H</sub> followed by 2 bytes of Command Data.

MSB (loaded first)		Bit Numbers												LSB (loaded last)	
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
“0”	CAL/ CUES	$V_{BIAS}/$ Enable	These 13 bits (0 to 12) are used to produce a binary number, designated “B.” “B” is used in the formulas below to set the Tx Tone 2 frequency ( $f_{TONE 2}$ ).												
The binary number produced by bits 0 to 12 (MSB) is designated “B.” If “B” = all logic “0” then Tx Tone Generator 2 is Powersaved.						Bit 13 at logic “1” = Tone 1 Output at $V_{BIAS}$ (NOTONE). “0” = Tone 1 Output Enabled. Bit 14 at logic “1” = Squarewave CAL Output. “0” = Sinewave CUES Output. Bit 15 (MSB) must be a logic “0.”									
<i>Table 5 Setting Tx Tone Generator 2</i>															

### Notes

- (1) Programming Tone Generator 2 to  $V_{BIAS}$  (NOTONE) (Bit 13) will place the CAL/CUES Output at  $V_{BIAS}$  via a 40kΩ internal resistor.
- (2) Programming Tone Generator 2 to Powersave will place the CAL/CUES Output at  $V_{SS}$ .
- (3) If both Tone Generators (1 and 2) are Powersaved, the Summing Amplifier is also Powersaved.

## Calculations

As can be seen from Tables 4 and 5 (above), a binary number (“A” or “B” – Bits 0 to 12) is loaded to the respective Tx Tone Generator. The formulas shown below are used to calculate the required output frequency.

$$\begin{aligned} \text{Required Tx Tone output frequency} &= f_{TONE 1 \text{ or } 2} \\ \text{XTAL/clock frequency} &= f_{XTAL} \\ \text{Input Data Word (Bits 0 to 12)} &= \text{“A” or “B”} \end{aligned}$$

Formula	
$f_{TONE (Hz)} = \frac{f_{XTAL (Hz)}}{4 \times \text{“A” (or “B”)}} \quad \text{or} \quad \text{Input “A” (or “B”)} = \frac{f_{XTAL (Hz)}}{4 \times f_{TONE (Hz)}}$	

## Tx Tone Frequencies

With reference to Tables 4 and 5 (above), whilst Input Data Words “A” or “B” can be programmed for frequencies outside the stated limits of 208Hz and 3000Hz, any output frequencies obtained may not be within specified parameters (see “Specification” page).

# Controlling Protocol .....

“Read Rx Tone Frequency Register” – A/C 32<sub>H</sub>, followed by 2 bytes of Reply Data.

## Measurement of Rx Signal Frequency (S<sub>INPUT</sub>)

The measurement details given on Pages 10 and 11 are for a Xtal/clock frequency (f<sub>XTAL</sub>) of 4.032MHz, a scaling formula for other values of f<sub>XTAL</sub> is given at the bottom of this page.

The input audio signal (S<sub>INPUT</sub>) is filtered and measured in the Frequency Counter over a specified “measurement period” (9.125 ms or 18.250 ms).

The measuring function counts the number of complete input cycles occurring within the measurement period and then the number of measuring-clock cycles necessary to make up the period.

When the count period of a successful decode is complete, the Rx Tone Measurement bit in the Status Register, and the Interrupt bit (if enabled) are set.

The Rx Tone Frequency Register will now indicate the signal frequency (S<sub>INPUT</sub>) in the form of 2 bytes (1 and 0) as illustrated in Figure 6 below.

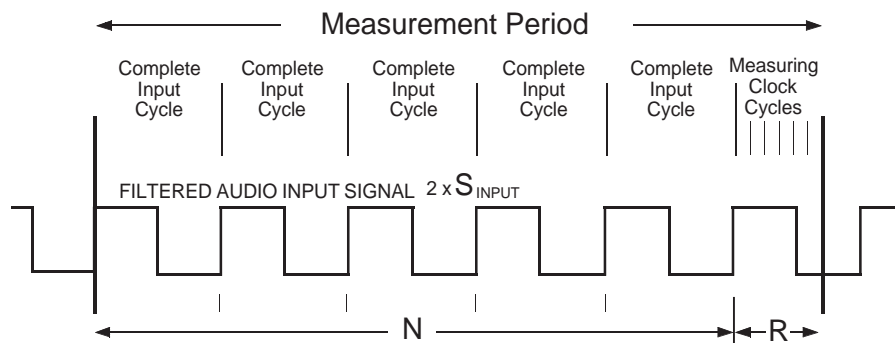

Fig.5 Measurement of a Mid or High Band Rx Frequency

### The Integer (N) – Byte 1

A binary number representing ‘twice the number of complete input audio cycle periods’ counted during the specified measurement period, which is:

High Band Decode	=	9.125 ms	=	“t”
Mid Band Decode	=	18.250 ms	=	“t”
Extended Band Decode	=	9.125 ms	=	“t”

See the bottom of this page for “t” and “f” scaling factors

### The Remainder (R) – Byte 0

A binary number representing the remainder part, R, of 2 x Input Signal Frequency (S<sub>INPUT</sub>). ‘R = number of specified measuring-clock cycles’ required to complete the specified measurement period (See N).

The clock-cycle frequencies are:

High Band Decode	=	56.00 kHz	=	“f”
Mid Band Decode	=	28.00 kHz	=	“f”
Extended Band Decode	=	56.00 kHz	=	“f”

Fig.6 Format of the Rx Tone Frequency Register

### f<sub>XTAL</sub> Scaling Factors

The calculations above are for an f<sub>XTAL</sub> of 4.032MHz. The following formulas enable the calculation of these values using any Xtal value. Note: f<sub>XTAL</sub> values are stated in MHz.

$$\begin{aligned}
 \text{“t”}_{\text{scaled}} &= \text{“t”} \times \left[ \frac{4.032}{f_{\text{XTAL}}} \right] \\
 \text{“f”}_{\text{scaled}} &= \text{“f”} \times \left[ \frac{f_{\text{XTAL}}}{4.032} \right]
 \end{aligned}$$

# Controlling Protocol .....

## Frequency Measurement Formulæ

To assist in the production of 'look-up' tables and limit-values in the µController and provide guidance upon the determination of N and R from a measured frequency, the following formulæ show the derivation of the Rx frequency,  $S_{INPUT}$ , from the measured data bytes (N and R), Figure 6.

### High Band Measurement

#### $S_{INPUT}$ – High Band

In the measurement period of 9.125ms, there are  $N_h$  cycles at  $2S_{INPUT}$  and  $R_h$  clock cycles at 56.000kHz.

$$\text{so } \frac{N_h}{2 \times S_{INPUT}} + \frac{R_h}{56000} = 9.125\text{ms}$$

$$\text{From which } S_{INPUT} = \frac{28000 \times N_h}{(511 - R_h)} \text{ Hz} \quad [1]$$

#### $N_h$ and $R_h$ – High Band

The measurement period = 9.125ms  
 Clock Frequency = 56.000kHz  
 The measured frequency =  $2 \times S_{INPUT}$  c/s

In the measurement period there are:  
 $2 \times S_{INPUT} \times 9.125 \times 10^{-3}$  cycles

$N_h$  is the lower integer value of this decimal number:

$$N_h = \text{INT} (9.125 \times 10^{-3} \times 2 \times S_{INPUT}) \quad [4]$$

$R_h$  is rounded to the nearest integer of this decimal number:

$$R_h = \frac{(9.125 \times 10^{-3} - N_h) \times 56000}{2 \times S_{INPUT}} \quad [5]$$

### Mid Band Measurements

#### $S_{INPUT}$ – Mid Band

In the measurement period of 18.250ms, there are  $N_m$  cycles at  $2S_{INPUT}$  and  $R_m$  clock cycles at 28.000kHz.

$$\text{so } \frac{N_m}{2 \times S_{INPUT}} + \frac{R_m}{28000} = 18.250\text{ms}$$

$$\text{From which } S_{INPUT} = \frac{14000 \times N_m}{(511 - R_m)} \text{ Hz} \quad [2]$$

#### $N_m$ and $R_m$ – Mid Band

The measurement period = 18.250ms  
 Clock Frequency = 28.000kHz  
 The measured frequency =  $2 \times S_{INPUT}$  c/s

In the measurement period there are:  
 $2 \times S_{INPUT} \times 18.250 \times 10^{-3}$  cycles

$N_m$  is the lower integer value of this decimal number:

$$N_m = \text{INT} (18.250 \times 10^{-3} \times 2 \times S_{INPUT}) \quad [6]$$

$R_m$  is rounded to the nearest integer of this decimal number:

$$R_m = \frac{(18.250 \times 10^{-3} - N_m) \times 28000}{2 \times S_{INPUT}} \quad [7]$$

### Extended Band Measurements

#### $S_{INPUT}$ – Extended Band

In the measurement period of 9.125ms, there are  $N_e$  cycles at  $S_{INPUT}$  and  $R_e$  clock cycles at 56.000kHz.

$$\text{so } \frac{N_e}{S_{INPUT}} + \frac{R_e}{56000} = 9.125\text{ms}$$

$$\text{From which } S_{INPUT} = \frac{56000 \times N_e}{(511 - R_e)} \text{ Hz} \quad [3]$$

#### $N_e$ and $R_e$ – Extended Band

The measurement period = 9.125ms  
 Clock Frequency = 56.000kHz  
 The measured frequency =  $S_{INPUT}$  c/s

In the measurement period there are:  
 $S_{INPUT} \times 9.125 \times 10^{-3}$  cycles

$N_e$  is the lower integer value of this decimal number:

$$N_e = \text{INT} (9.125 \times 10^{-3} \times S_{INPUT}) \quad [8]$$

$R_e$  is rounded to the nearest integer of this decimal number:

$$R_e = \frac{(9.125 \times 10^{-3} - N_e) \times 56000}{S_{INPUT}} \quad [9]$$

*Table 6 Rx NOTONE Timer Settings*

### Operation of the Rx NOTONE Timer

An Rx NOTONE period is that period when no signal or a consistently bad-quality signal is received.

The Rx NOTONE Timer can be employed to indicate to the µController that a NOTONE situation has existed for a predetermined period.

This timer register can be written-to and set in any mode of the FX803.

The NOTONE Timer period is ‘primed’ by writing to the NOTONE Timer Register (33<sub>H</sub>) using the settings given in Table 6.

**“Priming” sets the timing period; this period can only start directly after a frequency (tone) measurement has been successfully completed.**

The NOTONE Timer is a one-shot timer being reset only by successful tone measurements.

If the quality of the received signal drops to an unusable level the NOTONE Timer will start its run-down.

On completion of the preset period, the NOTONE Timer Period Expired bit in the Status Register and the Interrupt (when enabled, Table 2) are set.

Upon detection of the Interrupt, the Status Register should be read by the µController to ascertain the source of the Interrupt.

The NOTONE Timer Period Expired bit is cleared:

- i By a read of the Status Register or,
- ii New NOTONE Timer information or,
- iii General Reset command

This timer is set to 00<sub>H</sub> (0ms) by a General Reset command.

The following situations may be encountered by the NOTONE Timer circuitry:

#### No Signal

The NOTONE Timer can only start its run down on completion of a valid frequency measurement.

#### Signal Fades after a Valid Tone Measurement

The timer will start to run down when the signal becomes unreadable to the device. At the end of the “primed” period the NOTONE Timer Period Expired bit in the Status Register and the Interrupt will be set.

#### No Signal after a Valid Tone Measurement

The timer will start to run down when the last Rx Tone Measurement complete bit is set. At the end of the “primed” period the NOTONE Timer Period Expired bit in the Status Register and the Interrupt will be set.

#### Signal Appears after the Timer has Started

If the frequency measurement is more than 75% complete when the timer period expires, neither the NOTONE bit nor the Interrupt will be set unless that frequency measurement is subsequently aborted.

## Controlling Protocol .....

“Write to General Purpose Timer Register” – A/C 36<sub>H</sub> followed by 1 byte of Command Data.

Setting				Function/Period	
<b>MSB</b>					
<b>7</b>	<b>6</b>	<b>5</b>	<b>4</b>	<b>Transmitted Bit 7 First</b>	
0	0	0	0	These 4 bits must be “0”	
<b>3</b>	<b>2</b>	<b>1</b>	<b>0</b>	<b>High/Extended Band</b>	<b>Mid Band</b>
				Reset Timer and Start Timing	
0	0	0	0	Period of	0 0
0	0	0	1	" 10 ms ±1%	20 ms ±1%
0	0	1	0	20 "	40 "
0	0	1	1	30 "	60 "
0	1	0	0	40 "	80 "
0	1	0	1	50 "	100 "
0	1	1	0	60 "	120 "
0	1	1	1	70 "	140 "
1	0	0	0	80 "	160 "
1	0	0	1	90 "	180 "
1	0	1	0	100 "	200 "
1	0	1	1	110 "	220 "
1	1	0	0	120 "	240 "
1	1	0	1	130 "	260 "
1	1	1	0	140 "	280 "
1	1	1	1	150 "	300 "

*Table 7 General Purpose Timer Settings*

### Operation of the General Purpose Timer

This timer, which is not dedicated to any specific function within the FX803, can be employed within the DBS 800 system to indicate time-elapsing periods of between 10ms and 150ms in the High/Extended Band, 20ms and 300ms in the Mid Band, to the  $\mu$ Controller.

Setting of the timer is by loading a single-byte data word via the “C-BUS,” as indicated in Table 7 (left), to the FX803 via the Command Data line.

The timer will be reset and the run-down started on completion of Timer Data Word loading.

When the programmed time period has expired, the General Purpose Timer Expired bit (Bit 2) in the Status Register and the Interrupt (if enabled) are set.

The General Purpose Timer Expired bit is cleared:

- i By a read of the Status Register, or
- ii New G/P Timer information, or
- iii General Reset command.

When the programmed time period has expired, this timer will reset, restart and continue sequencing until;

- i New G/P Timer information is written, or
- ii A General Reset command.

The General Purpose Timer Expired bit and the Interrupt will remain set until cleared.

This timer is set to 00<sub>H</sub> (0ms) by a General Reset command.

## Powersave

Various sections of the FX803 can be placed independently into a power economical condition. Table 8 (below) gives a brief summary of the inactive, power-economical states available to the FX803.

Powersaved Section	Instruction Source		Table
Tone Encoder 1	Tx Tone Gen.1 Reg. (34 <sub>H</sub> )	All bits = “0”	4
Tone Encoder 2	Tx Tone Gen.2 Reg. (35 <sub>H</sub> )	All bits = “0”	5
Summing Amplifier	This action is automatic when both Tone Encoders are in the powersave condition.		

*Table 8 FX803 Powersave Functions*

## Powersave Conditions

**Xtal/Clock and “C-BUS”:** This circuitry is always active, on all DBS 800 microcircuits, under any powered/powersaved conditions.

# Controlling Protocol .....

## Interrupt Requests

An Interrupt ( $\overline{IRQ}$ ), when enabled, is provided by the FX803 to indicate the following conditions to the  $\mu$ Controller.

<b>NOTONE Timer Period Expired</b>
------------------------------------

**Enabled:** By Control Register Bit 5.  
**Set:** When the preset Notone Flag is set.  
**Identified:** By Status Register Bit 1.  
**Cleared:** By reading the Status Register.

<b>G/Purpose Timer Period Expired</b>
---------------------------------------

**Enabled:** By Control Register Bit 6.  
**Set:** When the General Purpose Timer has timed out.  
**Identified:** By Status Register Bit 2.  
**Cleared:** By reading the Status Register.

<b>Rx Tone Measurement Complete</b>
-------------------------------------

**Enabled:** By Control Register Bit 5.  
**Set:** When an Rx Frequency Measurement has been successfully completed.  
**Identified:** By Status Register Bit 0.  
**Cleared:** By reading the Status Register.

On recognition of the "Read Status" Command byte, the interrupt output is cleared, the Status Bits are transferred to the  $\mu$ Controller via the "C-BUS" Reply Data line and the internal Status Bits are cleared.

## Operational Recommendations

It is recommended that, following initial System power-up a General Reset command is sent to the FX803.

### Receive Sequence

1. Send Control Command for Rx:  
Select Midband/Highband and Digital Filter length.
2. Disable transmitters, if desired by writing to Tone Frequency registers.
3. Prime the NOTONE Timer by sending the required period byte.
4. Enable Decoder interrupts as desired.
5. When a valid tone has been detected by a successfully completed measurement the Status Register is set to "Tone Measurement Complete" and an interrupt sent to the  $\mu$ C.
6. The  $\mu$ C examines the Status Register, if tone measurement is complete, reads in the Rx Tone Frequency in the form N + R (Figure 6).
7. Rx Tone Measurement Complete interrupts are periodically sent to the  $\mu$ C unless NOTONE is detected, in which case a NOTONE Interrupt is sent.

### Transmit Control Sequence

1. Set Tone Frequency Generators to  $V_{BIAS}$  (setting both tone generators (Bit 13 = "1")) during the transmitter initialization period.
2. Send Control Command for Tx:  
Select Sum/Switched Sum o/p and Audio Switch states.
3. Send General Purpose (GP) Timer information for the  $V_{BIAS}$  (NOTONE) transmitter initialization period (Step 1). This will initiate the timer.
4. Enable the General Purpose Timer interrupt.
5.  $\mu$ C waits for "GP Timer Expired;" Reads the Status Register to check interrupt due to timer; Resets the Status Bit.  
If required, the  $\mu$ C sends the next timer period followed by the next tone(s) frequency information. A new timer period sent will reset the timer, otherwise the timer is self-sequencing.
6. The  $\mu$ C monitors the interrupts and repeats 5 & 6 as required.
7. After last loaded tone the  $\mu$ C turns off the Tone Generator(s) by setting tone outputs to  $V_{BIAS}$  (NOTONE) (Tables 4 and 5).

## General Reset

Upon Power-Up the "bits" in the FX803 registers will be random (either "0" or "1"). A General Reset Command (01<sub>H</sub>) will be required to "reset" all microcircuits on the "C-BUS," and has the following effect upon the FX803.

Control Reg.	Set as 00 <sub>H</sub>
Status Reg. Bits 0, 1, 2.)	Set as 00 <sub>H</sub>
NOTONE Timer Reg.	Set as 00 <sub>H</sub>
Tone Gen. 1 Reg. (2 bytes)	Set as 0000 <sub>H</sub>
Tone Gen. 2 Reg. (2 bytes)	Set as 0000 <sub>H</sub>
Gen/Purpose Reg.	Set as 00 <sub>H</sub>

Sets the FX803 to:

Encoder High Band (625Hz to 3000Hz) – with interrupts disabled, both timers set to 00<sub>H</sub>.

It is recommended that both timers are set-up before interrupts are enabled, to prevent initial, undesired interrupts.

## Glossary of Abbreviations

Below is a list of abbreviations used within this Data Sheet.

$f_{XTAL}$	Xtal/clock frequency
$S_{INPUT}$	Audio input signal
$f_{TONE}$	Tone frequency

# Timing Information

## Timing Diagrams

Figure 7 shows the timing parameters for two-way communication between the  $\mu$ Controller and the FX803 on the "C-BUS." Figure 8 shows, in detail, the timing relationships for "C-BUS" information transfer.

Fig.7 "C-BUS" Timing Information

NOT TO SCALE

Parameter	Min.	Typ.	Max.	Unit
$t_{CSE}$	2.0	—	—	$\mu$ S
$t_{CSH}$	4.0	—	—	$\mu$ S
$t_{CSOFF}$	2.0	—	—	$\mu$ S
$t_{NXT}$	4.0	—	—	$\mu$ S
$t_{CK}$	2.0	—	—	$\mu$ S
$t_{CH}$	500	—	—	ns
$t_{CL}$	500	—	—	ns
$t_{CDS}$	250	—	—	ns
$t_{CDH}$	0	—	—	ns
$t_{RDS}$	250	—	—	ns
$t_{RDH}$	50.0	—	—	ns
$t_{HIZ}$	—	—	2.0	$\mu$ S

### Notes

- (1) Command Data is transmitted to the peripheral MSB (Bit 7) first, LSB (Bit 0) last. Reply Data is read from the FX803 MSB (Bit 7) first, LSB (Bit 0) last.
- (2) Data is clocked into the FX803 and into the  $\mu$ Controller on the rising Serial Clock edge.
- (3) Loaded data instructions are acted upon at the end of each individual, loaded byte.
- (4) To allow for differing  $\mu$ Controller serial interface formats, the FX803 will work with either polarity Serial Clock pulses.

# Specification

## Absolute Maximum Ratings

Exceeding the maximum rating can result in device damage. Operation of the device outside the operating limits is not implied.

Supply voltage		-0.3 to 7.0V
Input voltage at any pin (ref $V_{SS} = 0V$ )		-0.3 to ( $V_{DD} + 0.3V$ )
Sink/source current (supply pins)		+/- 30mA
(other pins)		+/- 20mA
Total device dissipation @ $T_{AMB} 25^{\circ}C$		800mW Max.
Derating		10mW/ $^{\circ}C$
Operating temperature range:	<b>FX803J</b>	-40 $^{\circ}C$ to +85 $^{\circ}C$ (cerdip)
	<b>FX803DW/LG/LS</b>	-40 $^{\circ}C$ to +85 $^{\circ}C$ (plastic)
Storage temperature range:	<b>FX803J</b>	-55 $^{\circ}C$ to +125 $^{\circ}C$ (cerdip)
	<b>FX803DW/LG/LS</b>	-40 $^{\circ}C$ to +85 $^{\circ}C$ (plastic)

## Operating Limits

All device characteristics are measured under the following conditions unless otherwise specified:

$V_{DD} = 5.0V$ .  $T_{AMB} = 25^{\circ}C$ . Xtal/Clock ( $f_{XTAL}$ ) = 4.032MHz. Audio Level 0dB ref: = 308mVrms @ 1kHz (60% deviation, FM).

Noise Bandwidth = 5.0kHz Band-Limited Gaussian.

## Notes

1. Device control pins; Serial Clock, Command Data, and  $\overline{\text{CS}}$ .
2. Reply Data output.
3. Reply Data and  $\overline{\text{IRQ}}$  outputs.
4. Leakage current into the “Off”  $\overline{\text{IRQ}}$  output.
5. Measurement Period = 9.125ms.
6. Decode Probability = 0.993.
7. Measurement Period = 18.250ms.
8. When set to Powersave.
9. For a good input signal.
10. The use of the FX803 at Xtal/clock frequencies above 4.0MHz will cause a shift in the overall performance parameters.

## Package Outlines

The FX803 is available in the package styles outlined below. Mechanical package diagrams and specifications are detailed in Section 10 of this document.

Pin 1 identification marking is shown on the relevant diagram and pins on all package styles number anti-clockwise when viewed from the top.

**FX803DW** 24-pin plastic S.O.I.C. (D2)

## Handling Precautions

The FX803 is a CMOS LSI circuit which includes input protection. However precautions should be taken to prevent static discharges which may cause damage.

**FX803J** 24-pin cerdip DIL (J4)

**FX803LG** 24-pin quad plastic encapsulated bent and cropped (L1)

**FX803LS** 24-lead plastic leaded chip carrier (L2)

## Ordering Information

**FX803DW** 24 pin plastic S.O.I.C. (D2)

**FX803J** 24-pin cerdip DIL (J4)

**FX803LG** 24-pin encapsulated bent and cropped (L1)

**FX803LS** 24-lead plastic leaded chip carrier (L2)

**CML Microcircuits**

COMMUNICATION SEMICONDUCTORS

## CML Product Data

In the process of creating a more global image, the three standard product semiconductor companies of CML Microsystems Plc (*Consumer Microcircuits Limited (UK)*, *MX-COM, Inc (USA)* and *CML Microcircuits (Singapore) Pte Ltd*) have undergone name changes and, whilst maintaining their separate new names (*CML Microcircuits (UK) Ltd*, *CML Microcircuits (USA) Inc* and *CML Microcircuits (Singapore) Pte Ltd*), now operate under the single title **CML Microcircuits**.

These companies are all 100% owned operating companies of the CML Microsystems Plc Group and these changes are purely changes of name and do not change any underlying legal entities and hence will have no effect on any agreements or contacts currently in force.

### CML Microcircuits Product Prefix Codes

Until the latter part of 1996, the differentiator between products manufactured and sold from MXCOM, Inc. and Consumer Microcircuits Limited were denoted by the prefixes MX and FX respectively. These products use the same silicon etc. and today still carry the same prefixes. In the latter part of 1996, both companies adopted the common prefix: CMX.

This notification is relevant product information to which it is attached.

Company contact information is as below:
